

Users of Google Chrome

Google Chrome has a generally accepted development fault in that it does not support ActiveX and Sharepoint which is the basis for many management programs. You can use them but you have to effectively tell Chrome to operate in Internet Explorer (IE) mode.

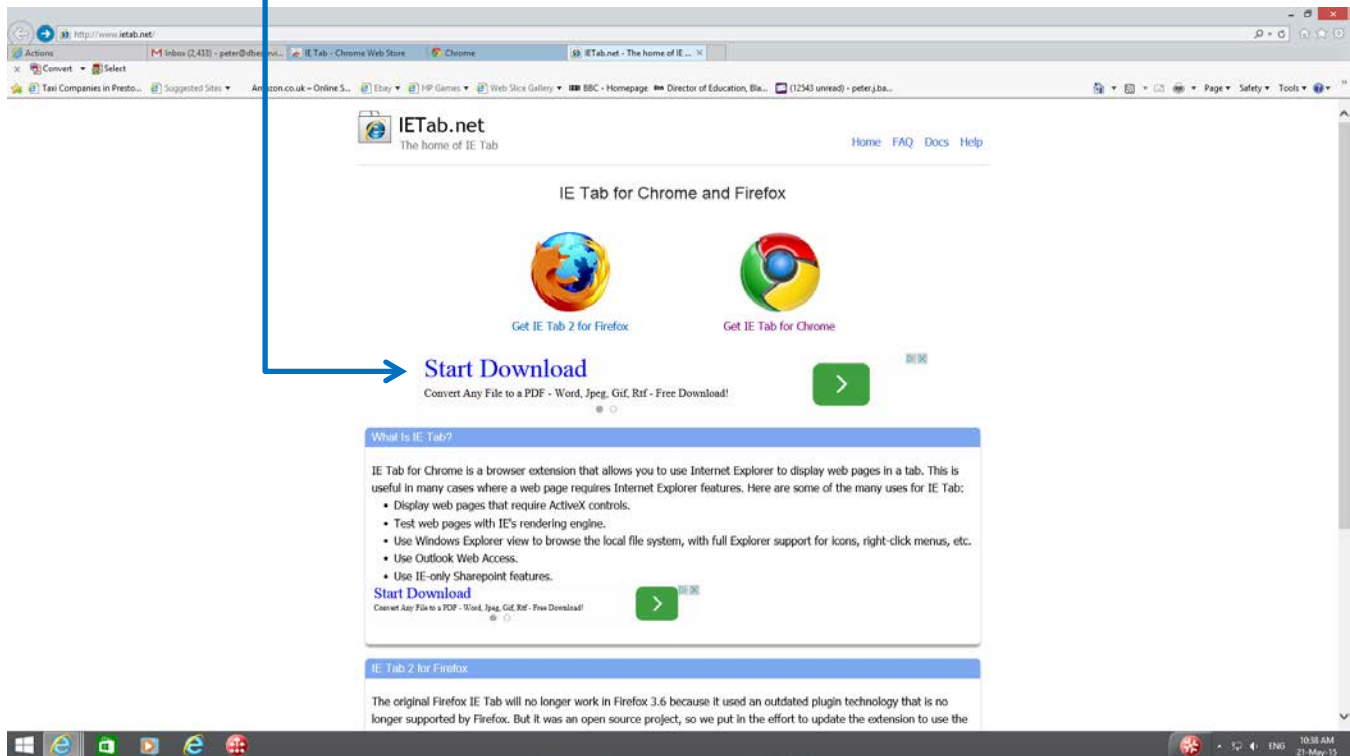

If you use Google Chrome you need to install the

[IETab.net](http://www.ietab.net)

You should be able to get to the relevant screen by placing the cursor over [IETab.net](http://www.ietab.net) or type <http://www.ietab.net/> into your browser this will bring up the following screen. Just click “Get it for Google Chrome” and follow instructions to add tab

Underneath the icons you will see Start Download **do not Start the Download** it will install something else.

You may need to restart the computer to get it to work but after it is installed go to www.tpm4.com and everything should be compatible

If you prefer a visual demonstration and an alternative way to achieve the same end there is a Youtube video available at <https://www.youtube.com/watch?v=J5vssAT8QoI> which shows you how to achieve the same result from your Google main screen
